Universität St.Gallen

Welcome to Law & Tech Entrepreneurship

From insight to impact.

Teaching team

Course coordinator:
Prof. Dr. Aurelia Tamò-Larrieux,
aurelia.tamo@unisg.ch

Course tutor:
PhD researcher, Dick Blankvoort
dick.blankvoort@unisg.ch

Our research looks at law and technology from two complementary perspectives: **technology as an object of regulation**, including how legal frameworks respond to technological change, and **regulation as an object of technology**, including how legal processes themselves are transformed through automation.

Together with a team at the Chair and the hands-on Legal Design & Code Lab we work across both perspectives and are interested in the intersections. The CS&Law Europe Network also fosters these interactions.

Current larger projects include CoCoDa, ARCL, DECODE, and REGULAIRE.

Together with Prof. Dr. Simon Mayer we have created an initiatives that enables us to bring our teams closer together: the Future Society Hub.

FuSo ABOUT PROJECTS EVENTS FOCUS AREAS PARTICIPATE TEAM CONTACT EN DE FR

UNIVERSITY OF ST.GALLEN

Future Society Hub

where tech and society fuse

A cross-disciplinary hub working across the full stack:
Analyze › Build › Deploy › Evaluate

› Society should not passively consume technological change but actively architect it. The Future Society Hub sets out to make this possible. We are a problem-solving space where researchers, organizations, and citizens shape technology around human values. Our stance is proactive: we anticipate technology-induced social shifts and shape technology through a societal lens.

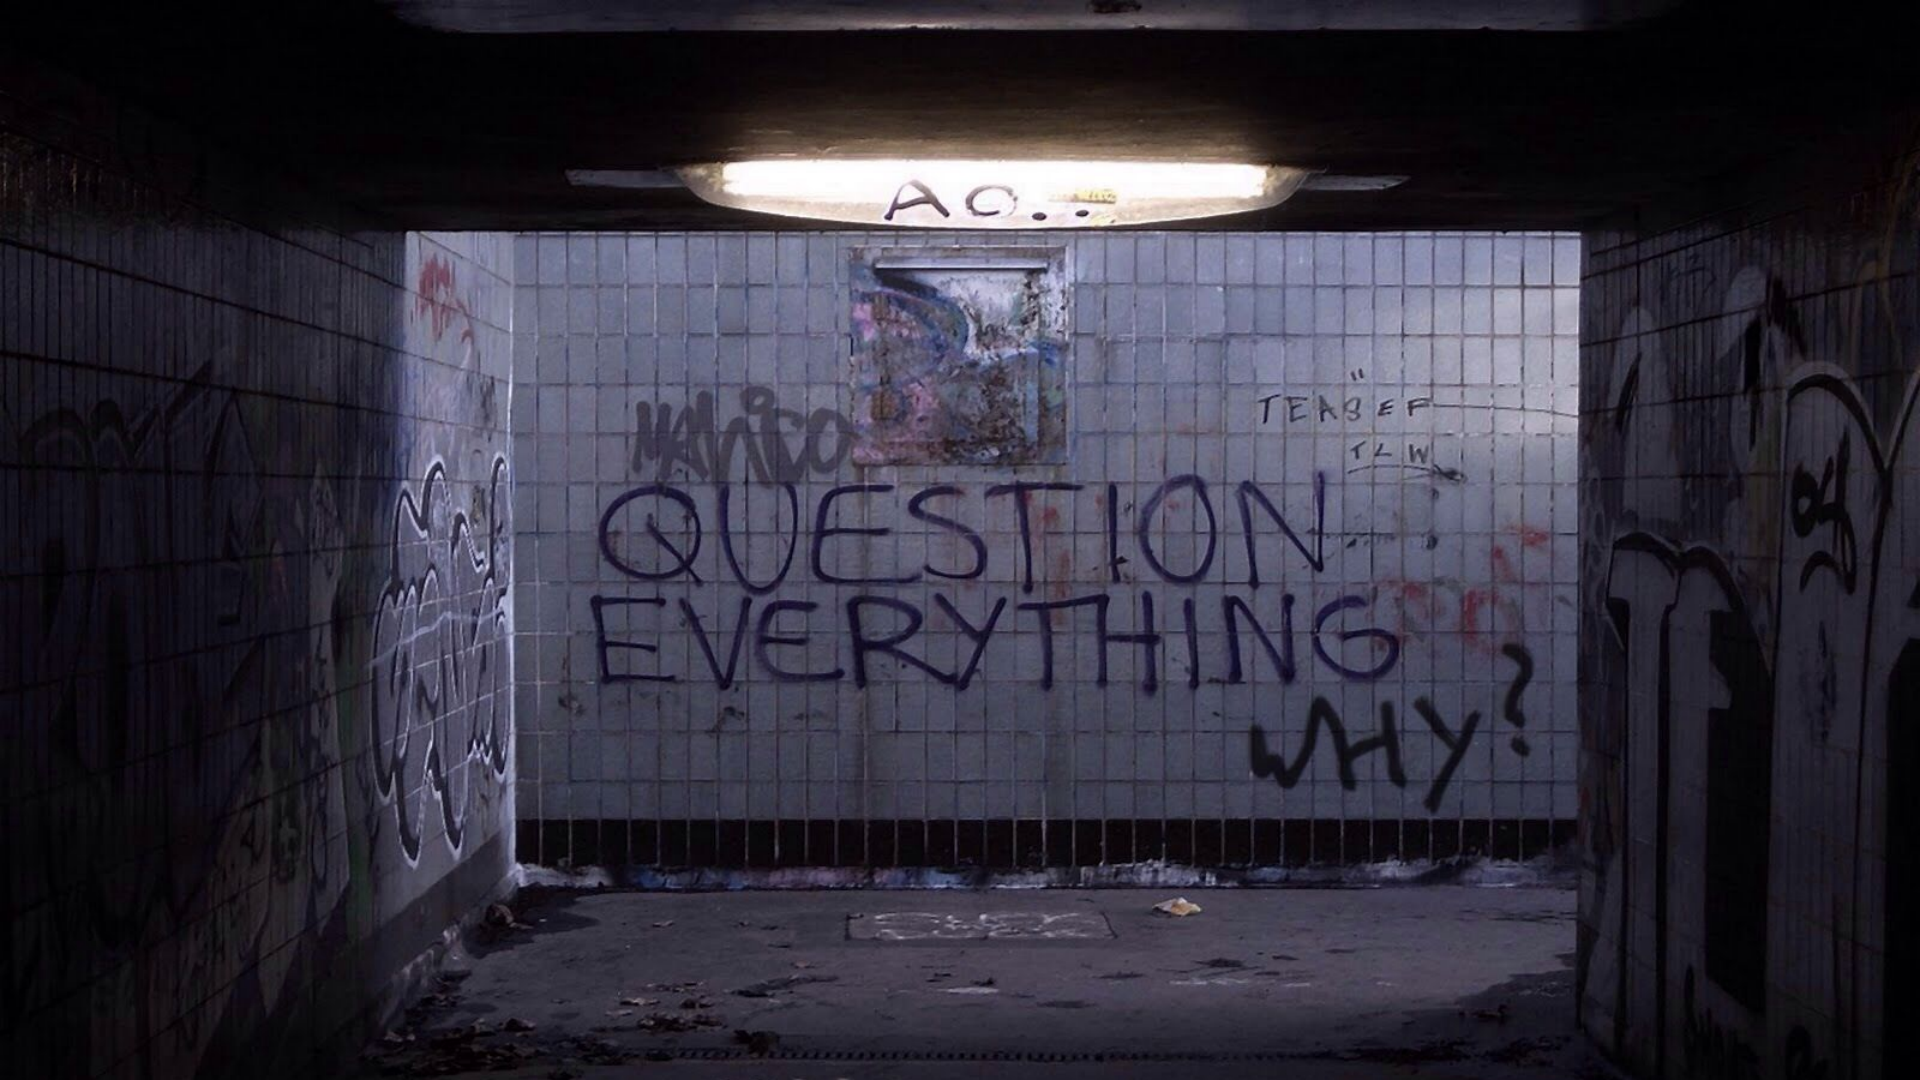

What are you interested in within the field of Law & Tech Entrepreneurship?

I am more of a **coder** than a doctrinal researcher….
I am more of a **legal enthusiast** than coder…..
I am more of a **business minded individual** than a legal enthusiast….

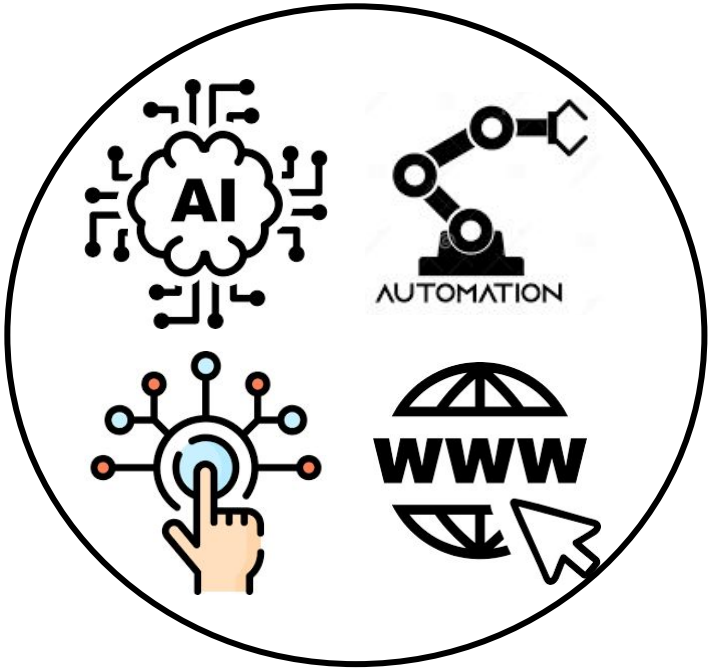

Please take 2-3 minutes to fill out the survey on Canvas….

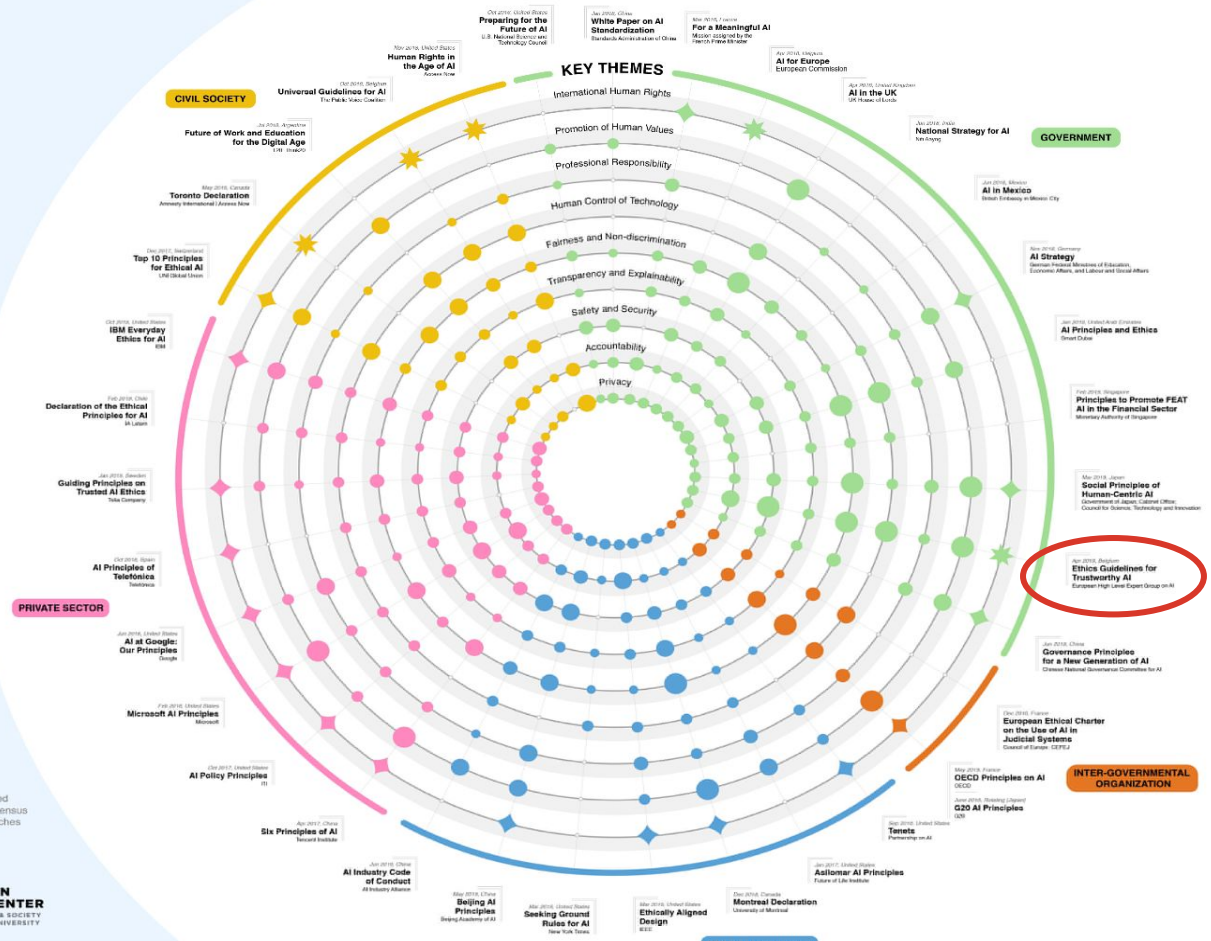

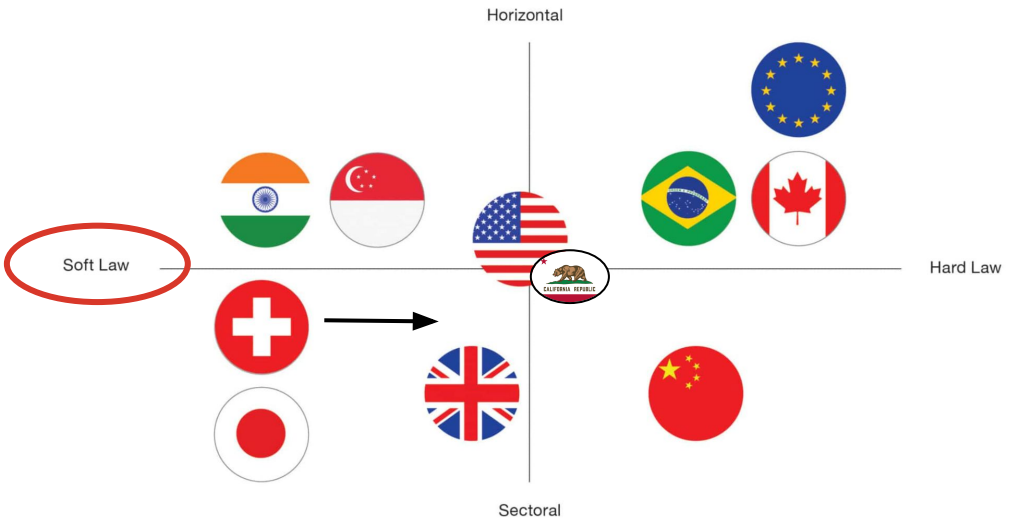

Figure 1. **NATIONAL APPROACHES TO AI GOVERNANCE**

Governing AI With Intelligence

BY URS GASSER

Patterns are emerging in the various efforts to regulate artificial intelligence around the globe. Understanding these evolving AI norms could help govern this technology intelligently.

Artificial intelligence is now decades in the making, but especially since the emergence of ChatGPT, policymakers and global publics have been focused on AI's promise and its considerable, even existential, risks. Driven by machine learning and other advanced computational methods, AI has become dramatically more capable. Benefits have already been realized in areas such as transportation, health care, and sustainable growth, and there are more to come. However, the benefits are matched by mounting concerns over safety, privacy, bias, accountability, and the spread of increasingly compelling misinformation created by generative AI. Lurking as well is the possibility that AI might outperform humans in some contexts, shrinking the sphere of human agency as more and more decisionmaking is left to computers.

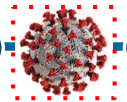

INSIGHTS FOR GOVERNANCE

While there is a growing consensus on the challenges of artificial intelligence and the opportunities it offers, there is less agreement over necessary AI guardrails. Urs Gasser surveys different approaches to AI regulation and discovers patterns that may help to govern this evolving technology intelligently.

- One recognizable pattern across AI governance arrangements relates to the different functions AI norms can play. Three kinds of norms are in operation today: 1) Constraint, which typically places limits on the development and use of AI; 2) Enabling, which permits or even promotes the development and use of AI (e.g., through funding or subsidies); 3) Attempts to create a level playing field, which include transparency and disclosure obligations, AI literacy programs in schools, and workforce training.
- Another pattern lies in the goals of diverse AI-governance arrangements, even as the means diverge: 1) Protection of established rights by, for example, shielding citizens against discrimination, fraud, and privacy invasions that emerge from AI use; 2) Protection of established interests through, for example, rules designed to promote economic activity, stimulate technological development through market mechanisms, and support the creation of new markets and business models; 3) Advancement of innovation with, for instance, provisions that seek to promote AI research and development.
- Three core insights emerging from a deeper analysis of the current state of affairs, which may inform AI initiatives in the near term and more distant future: 1) *Learning:* Institutions that take charge of AI governance need to ensure that the rules they put forward are flexible enough to adjust to changing circumstances; 2) *Interoperability:* Allow different arrangements to work together without aiming for total unification or harmonization; 3) *Capacity-building:* To translate policies, legal requirements, best practices, and technical standards into real-life use cases, governance initiatives should invest in implementation capacity, which includes AI literacy and technical assistance.

Dutch childcare benefits scandal

12 languages

This article needs to be **updated**. Please help update this article to reflect recent events or newly available information. *(December 2021)*

The **Dutch childcare benefits scandal** (Dutch: *kinderopvangtoeslagaffaire* or *toeslagenaffaire*, lit. '[childcare] benefits affair') is a political scandal in the Netherlands involving false allegations of welfare fraud by the Tax and Customs Administration (*Belastingdienst*) against thousands of families claiming childcare benefits.[1][2]

The typical red-and-white envelopes used by the Benefits agency, previously part of the *Belastingdienst*

Between 2005 and 2019, approximately 26,000 parents were wrongly accused of making fraudulent benefit claims, resulting in demands to repay their allowances in full.[1][3] In many cases, this sum amounted to tens of thousands of euros, driving families into severe financial hardship.[1][2]

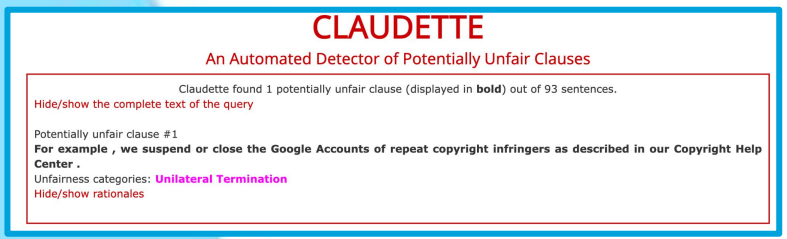

The scandal gained public attention in September 2018, prompting investigations that criticized the Tax and Customs Administration's procedures as discriminatory, particularly affecting parents with foreign backgrounds and characterized by institutional biases.[4][5] The severity of the issue culminated in the resignation of the third Rutte cabinet on 15 January 2021, just two months before the scheduled 2021 general election. A parliamentary inquiry into the affair concluded that it violated fundamental principles of the rule of law.[1][2][6]

GPT Takes the Bar Exam

7 Pages • Posted: 31 Dec 2022 • Last revised: 3 Jan 2023

Date Written: December 29, 2022

Abstract

Nearly all jurisdictions in the United States require a professional license exam, commonly referred to as "the Bar Exam," as a precondition for law practice. To even sit for the exam, most jurisdictions require that an applicant completes at least seven years of post-secondary education, including three years at an accredited law school. In addition, most test-takers also undergo weeks to months of further, exam-specific preparation. Despite this significant investment of time and capital, approximately one in five test-takers still score under the rate required to pass the exam on their first try. In the face of a complex task that requires such depth of knowledge, what, then, should we expect of the state of the art in "AI?" In this research, we document our experimental evaluation of the performance of OpenAI's text-davinci-003 model, often-referred to as GPT-3.5, on the multistate multiple choice (MBE) section of the exam. While we find no benefit in fine-tuning over GPT-3.5's zero-shot performance at the scale of our training data, we do find that hyperparameter optimization and prompt engineering positively impacted GPT-3.5's zero-shot performance. For best prompt and parameters, GPT-3.5 achieves a headline correct rate of 50.3% on a complete NCBE MBE practice exam, significantly in excess of the 25% baseline guessing rate, and performs at a passing rate for both Evidence and Torts. GPT-3.5's ranking of responses is also highly correlated with correctness; its top two and top three choices are correct 71% and 88% of the time, respectively, indicating very strong non-entailment performance. While our ability to interpret these results is limited by nascent scientific understanding of LLMs and the proprietary nature of GPT, we believe that these results strongly suggest that an LLM will pass the MBE component of the Bar Exam in the near future.

GPT-4 Passes the Bar Exam

Abstract

In this paper, we experimentally evaluate the zero-shot performance of a preliminary version of GPT-4 against prior generations of GPT on the entire Uniform Bar Examination (UBE), including not only the multiple-choice Multistate Bar Examination (MBE), but also the open-ended Multistate Essay Exam (MEE) and Multistate Performance Test (MPT) components. On the MBE, GPT-4 significantly outperforms both human test-takers and prior models, demonstrating a 26% increase over ChatGPT and beating humans in five of seven subject areas. On the MEE and MPT, which have not previously been evaluated by scholars, GPT-4 scores an average of 4.2/6.0 as compared to much lower scores for ChatGPT. Graded across the UBE components, in the manner in which a human tast-taker would be, GPT-4 scores approximately 297 points, significantly in excess of the passing threshold for all UBE jurisdictions. These findings document not just the rapid and remarkable advance of large language model performance generally, but also the potential for such models to support the delivery of legal services in society.

Generative AI Designed for Law

Expert-led Non-Profit Open-Access Independent

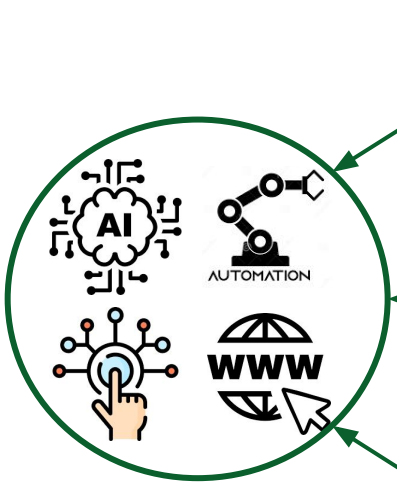

Our goal is to deliver accessible, reliable legal AI. OpenJustice, built on advanced language models for law, processes queries and documents, drawing from vast legal sources to provide precise, comprehensive answers and innovative tools for law students and lawyers. As a growing prototype, we value your feedback to improve and ensure OpenJustice's dependability.

OpenJustice is open to all lawyers and legal professionals with an institutional email.

Get Started

Law & Tech Entrepreneurship sits at these **interactions…**

Deep dive 1: data protection law and automated compliance

Deep dive 2: AI regulation and legal AI

Deep dive 3: Platform regulation and techno-legal tools

Law provides a framework (constraining, enabling, levelling the playing field) and gets automated in the process

Learning objectives

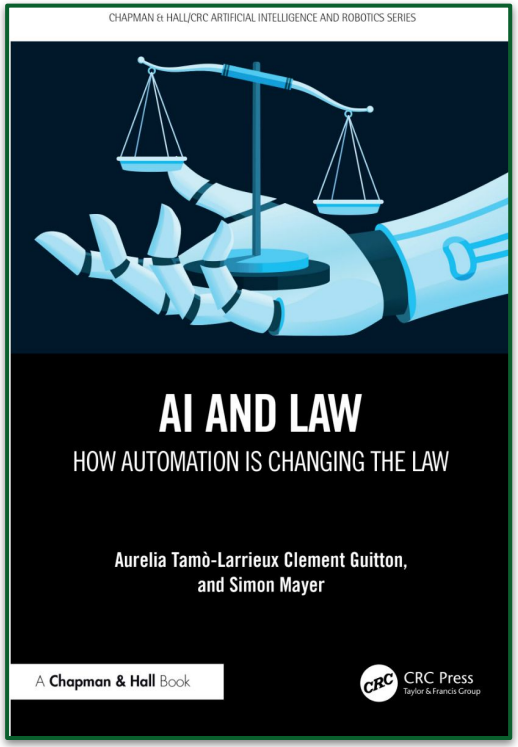

- Describe **practicable, future-facing solutions** that enable a symbiotic relationship between automation/AI, law, and society.
- Analyze **complex issues at the intersection of technology and law**, which necessitates the integration of several viewpoints/methods/fields.
- For students with a background in Computer Science: Understand key **technology law concepts** and how those can be **translated into functional system requirements** and evaluate those approaches (in terms of responsibility).
- For students with a background in Law and Law & Economics: Critically evaluate the **technical and ethical feasibility** of automating specific legal processes and the resulting impact on due process.
- For students with a Business Administration background: Identify and **leverage innovative potential of law & tech** to create value and optimize compliance.

Transversal skills

- Demonstrating a capacity for **creativity**.
- Working on a **concrete project** and writing a technical report.
- Setting objectives and designing an **action plan** to reach those objectives.
- Demonstrating the capacity for **critical thinking.**
- Evaluating your own performance in the team, receiving and responding appropriately to **feedback**.

Mandatory reading

Group work (70%): Occurs during the hackathon November 7-8th or shortly after (November 10th)

Technical and legal documentation and short report during the hackathon (40%)

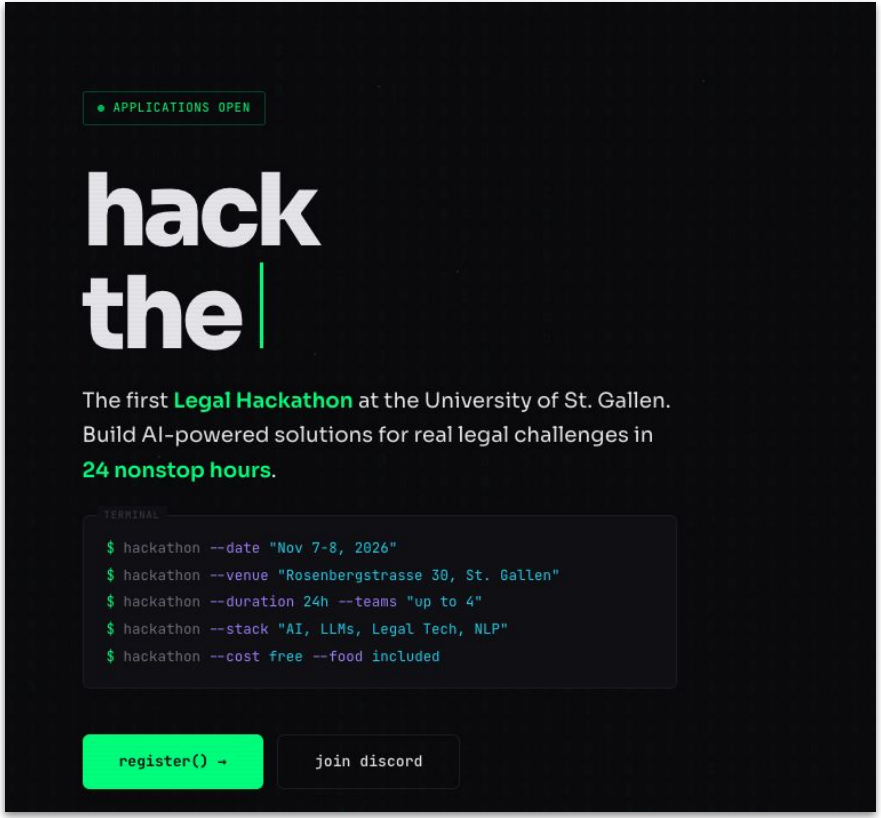

Recorded pitch of the work done (30%)

Recommended group size:
3 and interdisciplinary; max. 4 people per group.

Individual reflection (30%): Occurs after the hackathon (November 22nd)

Short reflection paper that includes a statement of your initial perspective on the interactions of law and technology and how this perspective changed throughout the course (provide examples that reflect your group work and readings you did over the semester).

Group registrations will occur on the legal hackathon website but we kindly ask you to mirror your groups within Canvas as you will be asked to also upload your project on Canvas…..
